

## Assignment -4

Assignment Date	22 October 2022
Student Name	DEEPA V
Role	Team Leader
Student Roll Number	113119UG07016
Maximum Marks	2 Marks
Team ID	PNT2022TMID22527

### Question-1:

Pull an Image from docker hub and run it in docker playground.

#### Solution:

- Pull an image *uifd/ui-for-docker* from the docker hub
- This image is used for viewing and managing the docker engine
- Use `docker pull image_name` and `docker run -it image_name` commands to
- run the above image in the Docker Playground

The screenshot displays the Docker Playground interface. On the left, there's a sidebar with a clock showing 03:57:32, a 'CLOSE SESSION' button, and an 'Instances' section. Below this, there's a '+ ADD NEW INSTANCE' button and a list of instances, including one with IP 192.168.0.8 and name 'node1'. The main area shows details for a specific instance named 'cddvksm0\_cddvkm0qau000a07j5g'. It lists the IP as 192.168.0.8, memory usage as 1.24% (49.52MiB / 3.906GiB), and CPU usage as 0.31%. There's an 'OPEN PORT' button and an SSH command: 'ssh ip172-18-0-22-cddvksm0qau000a07j50@direct.labs.pla'. Below this are 'DELETE' and 'EDITOR' buttons. The terminal output shows a warning message: 'WARNING!!!! This is a sandbox environment. Using personal credentials is HIGHLY discouraged. Any consequences of doing so are completely the user's responsibilities. The PwD team.' followed by the execution of 'docker pull hello-world' and 'docker run hello-world' commands, both of which were successful.

### Question-2:

Create a docker file for the jobportal application and deploy it in Docker desktop application.

#### Solution:

- Create a docker file for build and deploy flask app.

- Use docker build -t image\_name . in the current directory to start building the
- docker image and deploy in our local docker
- Use docker run -p 5000:5000 image\_name to run in local system

## CODE

FROM ubuntu/apache2

FROM python

COPY ./requirements.txt /flaskApp/requirements.txt

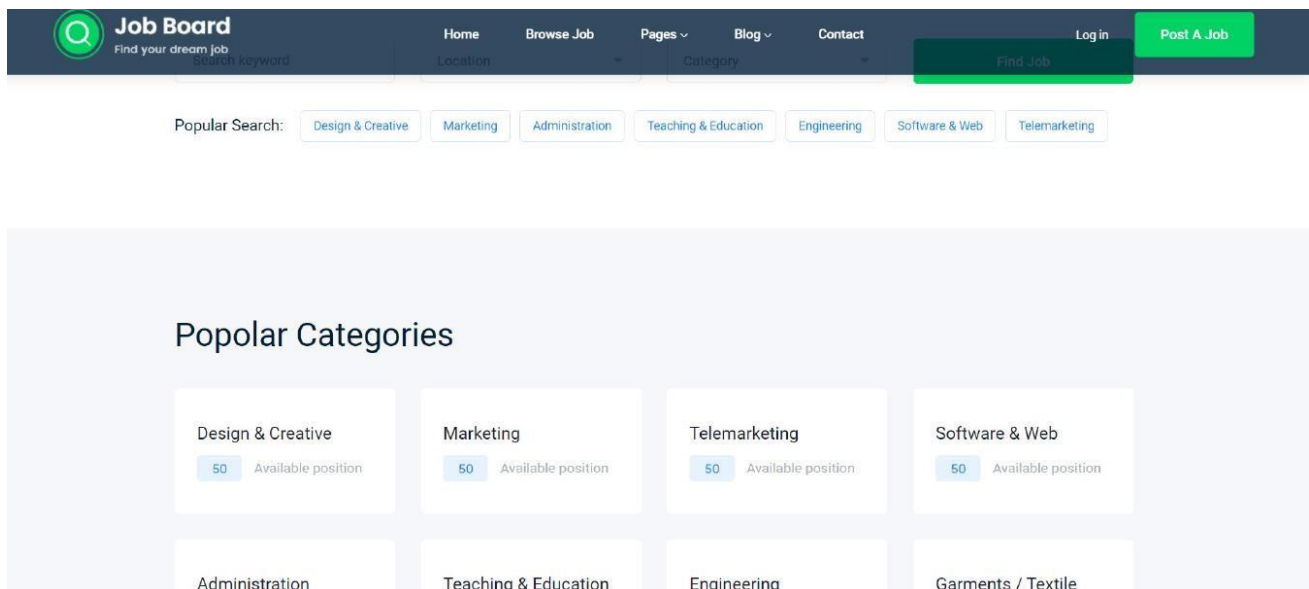

WORKDIR /flaskApp

RUN pip install -r requirements.txt

COPY . /flaskApp

ENTRYPOINT [ "python" ]

CMD ["app.py" ]

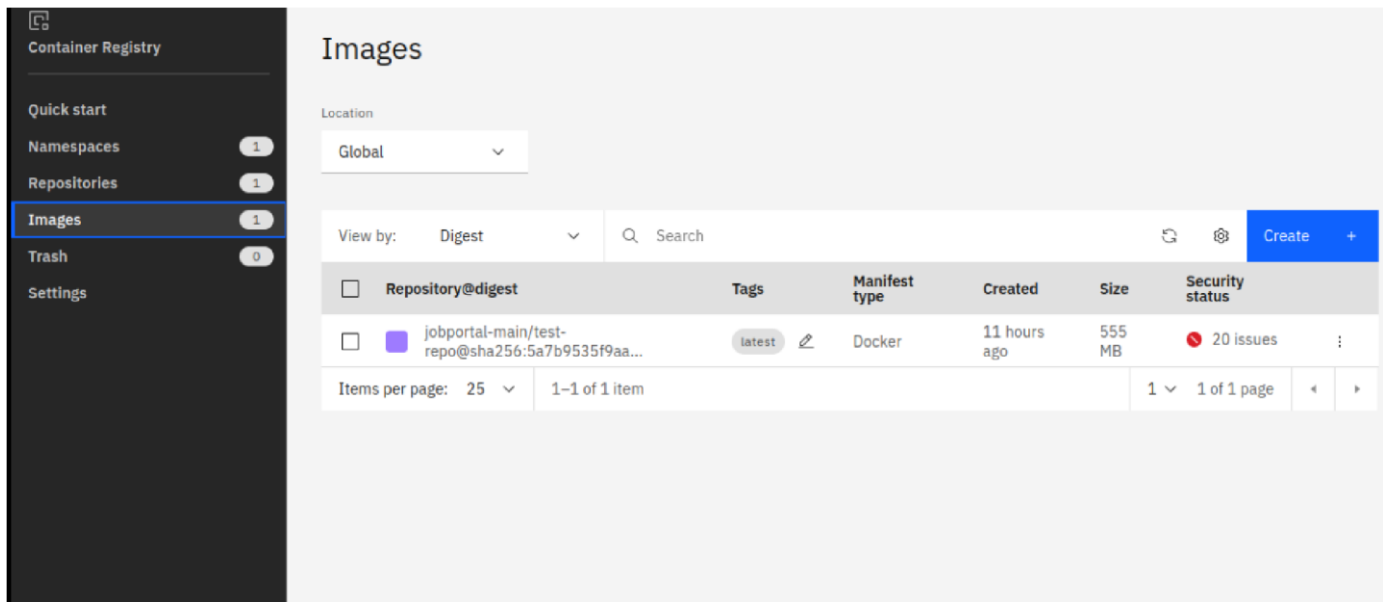

## Question-3:

Create a IBM container registry and deploy hello world app or job portal app.

### Solution:

- Log into IBM cloud
- Create a container registry
- Using IBM Cloud CLI, install the container registry plugin in our system
- Push our docker image into the created container registry using docker push
- So, our job portal app is deployed in the IBM container registry

OUTPUT: “HELLO  
WORLD”

#### Question-4:

Create a Kubernetes cluster in IBM cloud and deploy helloworld image or jobportal image and also expose the same app to run in nodeport.

#### Solution:

- Log into IBM cloud
- Create a kubernetes
- Using IBM Cloud CLI, install the ks plugin in our system
- Create a cluster in the kubernetes
- Now, go to the kubernetes dashboard where we need to create a service based on a
- yaml file (given below)
- In that file, we have to mention *which image we are going to use* and the *app name*
- Take the public IP address and Nodeport since we exposed the *flask app in nodeport*
- Finally, we got the url address where our flask app is hosted

#### CODE:

apiVersion: v1 kind:

Service metadata:

name: job-portal-app

spec:

selector:

app: job-portal-app

ports: - port: 5000

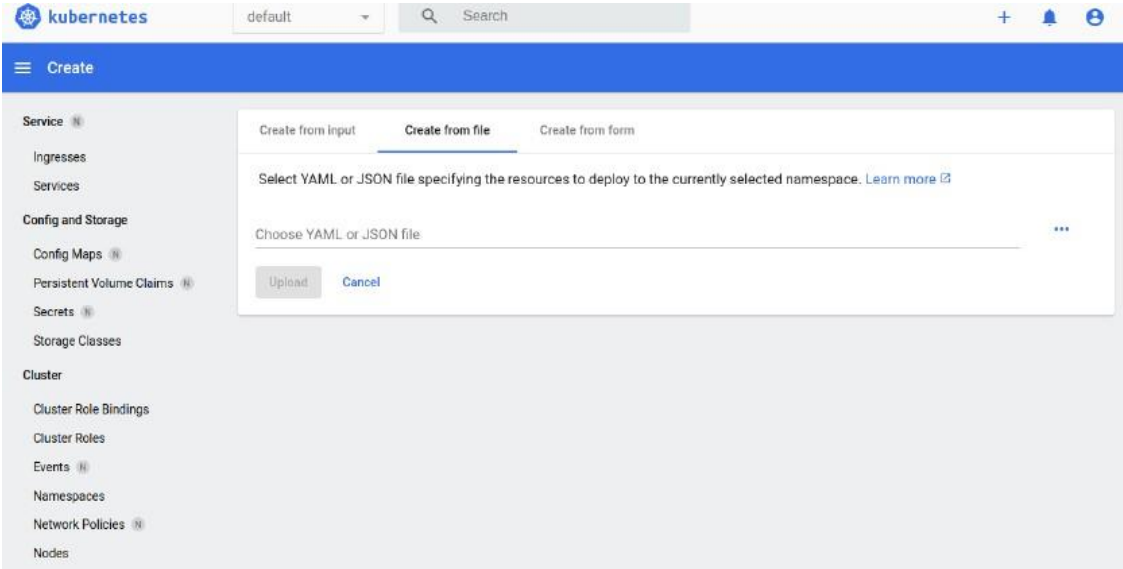

type: NodePort

---

apiVersion: apps/v1 kind:

Deployment metadata:

```
name: job-portal-app labels:
app: job-portal-app
spec: selector:
matchLabels: app:
job-portal-app
replicas: 1
template:
metadata: labels:
app: job-portal-app
spec: containers:
- name: job-portal-app
  image: image_name
  ports:
- containerPort: 5000 env:
- name:
  DISABLE_WEB_APP
value: "false"
```
